

GEMIN-EYE

Operations Manual

Lead-Generation Team — Standard Operating Procedures

Platform: gemin-eye.com

Document version: 1.0

Audience: Operations Team (Lead-Generation)

Last updated: April 2026

1. Overview

Gemin-Eye is an AI-powered lead-generation platform. It monitors online communities — Reddit, Google Alerts, Facebook Groups, and LinkedIn — for posts where people are actively seeking recommendations that match a client's business. When the AI detects a high-intent post, it scores the lead and drafts a natural-sounding reply, then sends an alert to Telegram (and optionally Slack) with one-tap buttons for the client to act on.

Your team's role is to keep the monitoring pipeline healthy. Reddit and Google Alerts run automatically on the server; Facebook and LinkedIn require a human to run the Spy Glass bookmarklet inside a real browser session. You also manage the Telegram bot on behalf of clients: onboarding new businesses, tuning keywords, and making sure lead alerts are being sent correctly.

1.1 How the System Works (End-to-End)

Step	What Happens	Who / What Does It
1. Monitor	Server continuously scans Reddit RSS feeds every 5 min and Google Alerts feeds every 2 min for keyword matches.	Server (automated)
2. Scrape	An operator opens a Facebook Group or LinkedIn feed in their browser and activates the Spy Glass bookmarklet. The script extracts post text and sends it to the server.	Operator (manual)
3. Score	Gemini 2.5 Flash rates each post's purchase intent on a scale of 1–10.	AI (automated)
4. Respond	For posts that score at or above the threshold, Gemini 2.5 Pro drafts a helpful, platform-appropriate reply.	AI (automated)
5. Alert	The lead + suggested response is delivered to the client via Telegram (and Slack if configured).	Server (automated)
6. Feedback	Client taps Used It / Bad Match / Too Salesy / Wrong Client buttons. Feedback improves future responses.	Client (manual)

1.2 Technology Snapshot

Component	Technology
Backend server	Node.js / Express (TypeScript)
Database	PostgreSQL via Drizzle ORM

AI scoring	Google Gemini 2.5 Flash
AI response generation	Google Gemini 2.5 Pro
Reddit monitoring	Reddit public RSS — /r/{subreddit}/new.rss (every 5 min)
Google Alerts monitoring	Google Alerts RSS feed (every 2 min)
Facebook / LinkedIn scraping	Browser bookmarklet (Spy Glass) — operator-driven
Notifications	Telegram Bot API; optional Slack incoming webhook
Web dashboard	React 18 / Vite at gemin-eye.com/dashboard
Admin panel	React at gemin-eye.com/admin

2. Access & Credentials

All credentials are stored in environment variables on the server. Operators should never store keys in plain text files or share them via unsecured channels. The table below lists what each key controls.

Environment Variable	Purpose	Where to Get It
DATABASE_URL	PostgreSQL connection string	Hosting provider dashboard
SESSION_SECRET	Express session signing	Generate once with: openssl rand -hex 32
AI_INTEGRATIONS_GEMINI_API_KEY	Gemini AI scoring & response generation	Google AI Studio (aistudio.google.com)
TELEGRAM_BOT_TOKEN	Bot API authentication	Telegram @BotFather → /newbot
TELEGRAM_CHAT_ID	Admin chat to receive all lead alerts	Send /start to @userinfobot
REDDIT_CLIENT_ID / SECRET / USERNAME / PASSWORD	Optional — enables auto-posting replies to Reddit	Reddit App Preferences
MONITORING_DISABLED	Set to 'true' to pause all automated monitors	Server config

WARNING

Never commit .env files to the repository. The .gitignore already excludes them. If a key is leaked, rotate it immediately in both the provider dashboard and the server environment.

3. Reddit RSS Monitor (Automated)

Reddit publishes a public RSS feed for every subreddit at the URL:

```
https://www.reddit.com/r/{subreddit}/new.rss
```

The server fetches this feed every 5 minutes for each subreddit listed in a client's active Reddit campaign. No login or API key is required — Reddit allows anonymous RSS access.

3.1 How the Scan Works

1. The monitor builds a list of all active Reddit campaigns and their target subreddits from the database.
2. It fetches the RSS feed for each unique subreddit (with a 5-second pause between subreddits to avoid rate limiting).
3. It checks the last 5 posts from each feed. Any post it has already seen (tracked via a deduplication key in the database) is skipped.
4. Each new post is filtered by the campaign's keyword list using a fuzzy keyword-matching algorithm.
5. Posts that pass the keyword filter are sent to Gemini Flash for intent scoring (1–10).
6. Posts scoring at or above the minimum threshold receive a full AI-generated response from Gemini Pro.
7. The lead and suggested reply are saved to the database and pushed to Telegram.

3.2 What Operators Need to Monitor

Because the Reddit monitor is fully automated, your primary responsibilities are to verify it is working and to keep the campaign configuration accurate.

3.2.1 Verify the Monitor is Running

Check the server logs. A healthy Reddit monitor will print a line similar to:

```
Reddit monitor: scanning 12 subreddits for 18 business targets...
Reddit monitor: scan complete (12/12 subreddits)
```

If you see this pattern every ~5 minutes, the monitor is healthy.

3.2.2 Common Error Messages and Actions

Log Message	Meaning	Action
HTTP 403 / Forbidden	Reddit is rate-limiting the server IP	Wait 15–30 min; check again. If persistent, report to admin.
HTTP 404 / Not Found	The subreddit name is invalid or private	Remove or correct the subreddit via /groups in Telegram.
Reddit monitor: DISABLED	MONITORING_DISABLED=true is set	Check server env vars; re-enable if appropriate.
Error processing post for {Business}	AI call failed for a single post	Transient — monitor will retry next cycle. Log for review if frequent.

3.2.3 Adding / Removing Subreddits

Use the Telegram bot admin command /groups. The bot will prompt you to select a business, then provide a comma-separated list of subreddits (with or without the r/ prefix). The monitor will pick up the change on the next scan cycle.

 WARNING

Subreddit names are case-insensitive but must contain no spaces. For example: r/chicagofood is valid; r/chicago food is not.

4. Google Alerts Monitor (Automated)

Google Alerts can deliver results as an RSS feed. The server polls each configured feed every 2 minutes. Leads discovered via Google Alerts may come from Quora, Reddit, Stack Overflow, YouTube, Medium, or general web pages.

4.1 Setting Up a Google Alert RSS Feed

Each client gets a Google Alerts campaign auto-created when they are onboarded. To add more feeds manually:

8. Go to google.com/alerts and sign in with the designated Gemin-Eye Google account.
9. Enter a search query. Use Quora-optimised searches such as:
`site:quora.com "best pizza in Chicago"`
`"where can I find" "immigration lawyer" -ad`
10. Click Show options. Set Deliver to: RSS Feed. Set How often: As-it-happens. Set How many: All results.
11. Click Create Alert. Google shows an RSS icon — click it and copy the full URL.
12. In Telegram, send /addalert, select the client business, and paste the RSS URL.
13. The server will begin polling the feed within 2 minutes.

4.2 Effective Search Query Patterns

Pattern	Example	Best For
site:quora.com "keyword"	site:quora.com "best accountant"	Direct question-and-answer leads
site:reddit.com "keyword"	site:reddit.com "recommend plumber"	Reddit posts not in monitored subreddits
"looking for" keyword	"looking for" "dog groomer" Chicago	High-intent, location-specific leads
"where can I" keyword	"where can I" "find a good dentist"	Active recommendation seekers
keyword -sponsored -ad	"home insurance" Chicago -sponsored	Filter paid content from results

4.3 Managing Existing Feeds

Use the following Telegram commands to manage Google Alert feeds:

Command	Action
/alerts	List all active Google Alert feeds and the businesses they are attached to.
/addalert	Attach a new RSS feed URL to a business.
/removealert	Deactivate and remove a feed from a business.

✓ **TIP**

Google Alerts RSS feeds expire if no queries are run against them for a long time. If a feed stops delivering results for more than a week, delete and recreate it.

5. Facebook Groups — Spy Glass Bookmarklet

Facebook does not provide a public API for group posts. Gemin-Eye handles this via a browser bookmarklet called Spy Glass. When an operator activates the bookmarklet while browsing a Facebook group, it silently reads post text visible on the page, sends it to the Gemin-Eye server for AI analysis, and highlights any posts identified as leads.

i NOTE

The bookmarklet runs inside the operator's own authenticated Facebook session and their own IP address. This is the same as a person reading the page — no credentials are exposed to the server.

5.1 First-Time Bookmarklet Setup

The bookmarklet URL is generated per-business by the server and provided to clients (or operators) from the Bookmarklets page of the web dashboard. The URL looks like:

```
https://gemin-eye.com/spy-glass.js?cid=426842568&bid=3&tok=abc123xyz
```

The parameters cid (Telegram chat ID), bid (business ID), and tok (security token) are pre-filled. To install:

14. Log in to the Gemin-Eye dashboard at gemin-eye.com/dashboard.
15. Navigate to the Bookmarklets section for the target client business.
16. Drag the Facebook Spy Glass button to your browser's bookmarks bar. Alternatively, right-click the button and choose 'Bookmark this link'.
17. Confirm the bookmark is visible in your bookmarks bar before proceeding.

5.2 Daily Facebook Scan Procedure

18. Open a new browser tab and log in to Facebook using the client's account (or your designated operator account that is a member of the target groups).
19. Navigate to the target Facebook group by URL or the Groups menu.
20. Once the group's feed has loaded (you can see posts), click the Spy Glass bookmark.
21. A purple banner appears at the top of the page reading 'Gemin-Eye: Auto-scanning...'. The counter shows the number of posts scanned and leads found.
22. Scroll down slowly through the group feed. The bookmarklet auto-scrolls at 600px every 1.5 seconds, but manual scrolling ensures no posts are missed.
23. Posts that match a lead are highlighted with a purple outline.
24. The scan stops automatically when it has checked 500 posts or when it detects no new posts for ~20 seconds.
25. Click Stop if you want to end early, or X to close the banner without stopping the scan.

5.3 Understanding the Scan Banner

Banner Element	Meaning
X scanned	Total number of unique post blocks sent to the server for analysis.
Y leads	Posts the AI determined to be leads — an alert has been sent to Telegram.
(Z checking...)	Posts currently being evaluated by the AI. Wait until this reaches 0 before navigating away.
Purple post outline	This post was identified as a lead. Do not edit or delete it.
'Done' in counter	Scan is complete. Safe to navigate or close the tab.

5.4 Groups to Monitor

Each client's Facebook groups are stored in their campaign settings and visible in the admin panel. Request the group list from the admin dashboard at gemin-eye.com/admin before starting a shift. Prioritise groups with high post volume and that are explicitly for recommendations (e.g., 'Chicago Recommendations', 'Ask a Local', 'Best Of [City]').

5.5 Troubleshooting Facebook Spy Glass

Problem	Likely Cause	Fix
'Missing configuration' alert on activation	Bookmarklet URL is missing cid/bid/tok params	Re-copy the bookmarklet from the dashboard Bookmarklets page.
Banner appears but no posts are scanned (0 scanned)	Page hasn't loaded posts yet	Wait for the feed to fully load, then click the bookmarklet again.
Counter shows many scanned but 0 leads	Posts don't match keywords; correct but no lead intent	Normal. Check keyword list via /keywords in Telegram.
Purple outline appears on a post but no Telegram alert	AI scored it as a lead but Telegram delivery failed	Check server logs and Telegram bot connectivity.
Facebook logs out mid-scan	Session expired	Log back in and re-run the bookmarklet from scratch.
'Gemin-Eye is already active' — no banner	Bookmarklet was already running on the tab	Refresh the page, then reactivate the bookmarklet.

6. LinkedIn — LI Spy Glass Bookmarklet

LinkedIn is handled with a separate bookmarklet called LI Spy Glass. The workflow is identical to the Facebook Spy Glass but targets the LinkedIn feed instead of Facebook groups. LinkedIn is generally lower volume but yields high-quality B2B leads.

6.1 Installation

Follow the same installation steps as Section 5.1, but use the LinkedIn Spy Glass bookmarklet button on the Bookmarklets page. The two bookmarklets are separate — you must install both if you are monitoring both platforms.

6.2 Daily LinkedIn Scan Procedure

26. Open a new tab and log in to LinkedIn using the designated operator account.
27. Navigate to your LinkedIn Home feed, or search for a relevant LinkedIn Group.
28. Once the feed has loaded, click the LI Spy Glass bookmark.
29. The same purple banner and auto-scroll behaviour applies.
30. For LinkedIn Groups specifically: navigate to the group, let the posts load, then activate the bookmarklet.
31. LinkedIn has stricter rate limits than Facebook. If the feed stops loading new posts, wait 2–3 minutes before scrolling further.

6.3 LinkedIn-Specific Notes

- LinkedIn posts are shorter on average. The AI will still score them accurately.
- Do not activate the bookmarklet on LinkedIn search results pages — only on feed or group pages.
- If LinkedIn shows a CAPTCHA or unusual login prompt, stop the scan and notify the admin. Do not attempt to bypass it.
- LinkedIn monitors connection-level posts by default. For group posts, the operator account must be a member of the target group.

WARNING

LinkedIn and Facebook accounts used for scanning must never be linked to the Gemin-Eye brand or domain. Use personal or pseudonymous operator accounts that appear as regular users.

7. Telegram Bot Operations

The Telegram bot is the primary command interface for managing clients and reviewing leads. All significant administrative actions — creating clients, updating keywords, managing alerts — are performed through the bot.

7.1 Admin Commands Reference

Command	What It Does	When to Use
/newclient	Starts a multi-step wizard to create a new business profile. Prompts for name, type, target audience, offering, tone, and keywords. AI auto-generates target subreddits and creates all campaigns.	Onboarding a new client.
/removeclient	Lists all businesses. Reply with a number to delete the selected business and all its campaigns, leads, and responses.	Offboarding a client or removing a test account.
/keywords	Lists businesses with their current keywords. Select one and send a new comma-separated keyword list to replace the current set.	Tuning lead detection accuracy.
/groups	Lists businesses with their current subreddits / Facebook groups. Select one and send a replacement list.	Adding or removing monitoring targets.
/addalert	Attaches a Google Alerts RSS URL to a business.	After creating a new Google Alert.
/alerts	Lists all active Google Alert feeds.	Auditing or reviewing active feeds.
/removealert	Lists all feeds; reply with a number to deactivate one.	Removing outdated or broken feeds.
/cancel	Aborts any in-progress wizard or multi-step command.	If you made a mistake mid-flow.

7.2 Reviewing Lead Alerts

When a lead is found on any channel, the bot sends a formatted message. Here is an example of a Reddit lead alert:

▫ Reddit Lead

Business: Marge's Diner
Subreddit: r/chicago
Intent: ★★★★★☆☆ 7/10

Why: User is asking for diner recommendations near them.

▫ Post:

"Best breakfast spots near O'Hare? Ideally something local and not a chain."

▫ Suggested Response:

"If you want something genuinely local, diners in Portage Park..."

▫ Tap 'Open Post' below, then paste the reply.

7.2.1 Feedback Buttons

Every lead alert includes four feedback buttons. These are critical — they train the AI for future responses.

Button	Meaning	Use When
Used It	The suggested response was helpful and was posted.	You or the client posted the reply (as-is or lightly edited).
Bad Match	The post was not actually a lead for this business.	The intent score was wrong — post is off-topic.
Too Salesy	The AI response was too promotional or pushy.	The response mentioned the business too explicitly or unsuitably.
Wrong Client	The lead matches a different business in the system.	The post is a lead but for a different client's product.

✓ TIP

Always tap a feedback button after reviewing each lead — even if you skip it. This data directly influences AI accuracy and saves the admin from having to audit manually.

7.3 Onboarding a New Client via Telegram

The /newclient wizard collects all required information in a conversational flow. Have the following information ready before starting:

- Business name (exact, as the client wants it used in responses)
- Business type (e.g., 'Italian restaurant in downtown Seattle')
- Target audience (e.g., 'Families and young professionals in the Seattle area')
- Core offering (1–2 sentences describing what they do and what makes them distinct)
- Preferred tone — choose one: Casual / Empathetic / Professional
- Seed keywords (at least 5–10 comma-separated phrases people might use when looking for this business)

After you provide the keywords, the AI will automatically generate a list of suggested subreddits and Facebook groups. Review this list — if any are obviously wrong, update them immediately with /groups.

7.4 Client Self-Onboarding via Telegram

Clients can also onboard themselves by clicking a Telegram bot deep link (t.me/your_bot?start=setup) and following the guided wizard. In this case, they supply their own Telegram chat ID as their notification destination. No operator action is needed unless the client needs help correcting their campaign configuration afterward.

8. Web Dashboard & Admin Panel

8.1 Dashboard (gemin-eye.com/dashboard)

The web dashboard gives a visual overview of all campaigns and leads for the logged-in user. Use it to:

- See the lead pipeline — matched, converted, or dismissed leads.
- Review AI-generated responses and their feedback ratings.
- Check campaign status (active / inactive).

The dashboard is read-only for most purposes. Use the Telegram bot for configuration changes.

8.2 Admin Panel (gemin-eye.com/admin)

The admin panel is accessible only to authenticated admin users. It provides full CRUD control over:

- All client businesses and their campaigns
- Keywords and target groups for every campaign
- Lead records and AI responses
- A monitoring kill switch — toggling `MONITORING_DISABLED` disables both the Reddit and Google Alerts monitors globally

WARNING

Use the admin panel kill switch only during maintenance windows or if the server is generating excessive API costs. Remember to re-enable monitoring afterward.

9. Daily Operations Checklist

Complete the following checks each business day. Tick off each item before ending your shift.

9.1 Morning Checks (Start of Shift)

#	Task	How to Verify
1	Confirm Reddit monitor is active	Check server logs for 'scan complete' within the last 5 minutes.
2	Confirm Google Alerts monitor is active	Check server logs for 'scanning X feeds' within the last 2 minutes.
3	Review overnight Telegram lead alerts	Scroll through the bot's chat history since last shift. Apply feedback buttons to any unanswered leads.
4	Check for Telegram delivery errors	If a business has been active but received no alerts in >12 hours, check whether its Telegram Chat ID is correct in the database.
5	Confirm all active campaigns show status 'active' in admin panel	Visit gemin-eye.com/admin and verify campaign statuses.

9.2 Facebook & LinkedIn Scan Rotation

Run the Spy Glass scan for each assigned Facebook group and LinkedIn target. Aim for at least one full scan per group per business day. High-volume groups (>50 posts/day) should be scanned twice.

Shift	Facebook Groups	LinkedIn
Morning (start of shift)	Scan all assigned groups once.	Scan LinkedIn home feed and any assigned groups.
Midday (if double-shift)	Re-scan high-volume groups.	Not required unless new leads expected.
End of shift	Log scan results in daily report.	Log scan results in daily report.

9.3 End-of-Shift Checklist

#	Task
1	Apply feedback buttons to all Telegram lead alerts received during the shift.
2	If a Reddit or Google Alerts error repeated more than 3 times during the shift, file an incident note with the admin.
3	Confirm no critical errors in server logs (403 loops, AI

	timeouts, database connection errors).
4	Update the shared shift log with: groups scanned, leads found, any issues encountered.

10. Troubleshooting Guide

10.1 No Telegram Alerts for a Business

Check	How
Is the campaign active?	Admin panel → verify campaign status is 'active'.
Is the Telegram Chat ID correct?	Admin panel → business record → telegramChatId field. Compare to the client's actual chat ID (send /start to @userinfobot from their Telegram).
Are keywords too restrictive?	Use /keywords to review. Try temporarily broadening the list for a test scan.
Is the Reddit / Google Alerts monitor running?	Server logs — look for scan activity.
Is the AI scoring threshold too high?	The minimum intent score (MIN_MONITOR_INTENT_SCORE) is a server constant. Contact admin if threshold adjustment is needed.

10.2 AI Responses Are Too Salesy or Off-Brand

If the client (or operator) repeatedly taps 'Too Salesy', the AI feedback loop will self-correct over time. To accelerate this:

- Apply feedback buttons consistently and promptly.
- Update the business core offering description to be more specific — vague offerings produce generic responses.
- Change the preferred tone via /newclient (remove and recreate the business) or update it directly in the database via the admin panel.

10.3 Spy Glass Bookmarklet Sends No Data

32. Verify the browser console (F12 → Console) shows no CORS or network errors.
33. Confirm the bookmarklet URL contains valid cid, bid, and tok parameters.
34. Try navigating to the group page directly (not via an in-app link) and reactivating.
35. If errors reference gemin-eye.com being blocked, check that the server is running and publicly accessible.

10.4 Reddit Monitor HTTP 403 / Rate Limiting

Reddit rate-limits anonymous RSS requests by IP. The monitor stagger-fetches subreddits with a 5-second delay, which helps. If 403s persist:

- Check whether the server IP has been flagged. Consider rotating or proxying the outbound IP.
- Reduce the number of subreddits per business — fewer than 10 per campaign is recommended.
- The monitor will self-recover on the next cycle; 403s are logged but do not crash the process.

10.5 Google Alerts Feed Returns No Results

- The alert query may be too narrow. Edit the alert on google.com/alerts and broaden the search terms.
- Google Alerts RSS feeds can become stale. Delete and recreate the alert if results have stopped for more than 3 days.
- Verify the RSS URL is still valid by pasting it into a browser — it should return XML content.

10.6 Escalation Path

Severity	Examples	Action
Low	Single feed 403, one missed alert	Log in shift report; monitor for recurrence.
Medium	Monitor not running for >30 min, multiple business alerts failing	Restart the server process; notify admin within 2 hours.
High	Database connection error, server crash, all alerts down	Notify admin immediately; do not attempt database repairs without authorization.

11. Keyword Strategy

Keywords are the first filter applied to every post before it reaches the AI scorer. Getting keywords right is critical — too broad and the AI wastes time on junk; too narrow and real leads are missed.

11.1 How Keyword Matching Works

The keyword engine uses a fuzzy matching algorithm that handles multi-word phrases and ignores common stop words. A post matches if any keyword phrase appears in the post text (title + body). Matching is case-insensitive.

11.2 Keyword Best Practices

Do	Don't
Use 2–4 word phrases that reflect real user language ('best pizza near me')	Use single generic words ('food', 'help')
Include location qualifiers for local businesses ('dentist in Chicago')	Include the business name itself — the AI already knows it
Include synonyms and related terms ('recommend', 'suggest', 'where to find')	Include competitor names — leads should be channel-agnostic
Use question-format phrases ('where can I find', 'looking for a')	Use overly long phrases (>6 words) — they rarely match exactly

✓ TIP

After changing keywords via /keywords, wait one full scan cycle (5 min for Reddit, 2 min for Google Alerts) before evaluating the impact. Facebook and LinkedIn rely on the next manual scan.

12. Platform Compliance & Conduct Rules

WARNING

Non-compliance with platform terms can result in account bans and reputational harm to clients. Read this section carefully.

12.1 Reddit

- Never post AI-generated replies from a new or low-karma account — new accounts are heavily scrutinised by Reddit's spam filters.
- AI-generated Reddit responses intentionally contain no business names, links, or promotional language. Do not add them before posting.
- Do not post more than 2–3 replies per day per account on the same subreddit.
- If a subreddit's rules prohibit any form of promotion, do not post replies there — mark those leads as 'Bad Match' and notify the admin to remove the subreddit.

12.2 Facebook

- The Spy Glass bookmarklet reads posts but does not post anything. Actual replies must be posted manually by the client from their own account.
- Never join a Facebook group on behalf of a client using an operator account — the group must be joined by the client personally.
- Do not run the bookmarklet on the same group more than twice per day.

12.3 LinkedIn

- LinkedIn is particularly sensitive to automated behaviour. Never activate the bookmarklet on a freshly created LinkedIn account.
- Avoid running the bookmarklet for more than 30 minutes in a single session.
- Do not paste AI-generated replies verbatim — always have the client personalise the response before posting.

12.4 General Rules

- Operator accounts must not identify themselves as working for Gemin-Eye.
- All scanning activity should look like normal human browsing — scroll at a human pace when the bookmarklet is not active.
- Report any platform ban or warning immediately to the admin. Do not create replacement accounts without authorization.

13. Glossary

Term	Definition
Business	A client business profile in the Gemin-Eye system. Each business has one or more campaigns.
Campaign	A monitoring configuration for a specific platform (Reddit, Facebook, Google Alerts). Holds the keywords and target groups.
Lead	A social media post identified by the AI as likely to convert — the author is seeking something the client offers.
Intent Score	A 1–10 rating from Gemini Flash indicating how likely the post author is to take action (buy, hire, visit). Leads below the minimum threshold are discarded.
Spy Glass	The browser bookmarklet script that scans Facebook or LinkedIn pages for post text and sends it to the server.
Deduplication	The process of skipping posts the system has already seen, preventing duplicate alerts for the same post.
RSS Feed	A standardised XML format used by Reddit and Google Alerts to publish real-time content that the server can poll.
Telegram Chat ID	A unique numeric identifier for a Telegram chat or user. The server uses this to deliver lead alerts to the correct destination.
Feedback Loop	The mechanism by which client feedback on lead quality (Used It, Bad Match, etc.) is fed back into the AI's future response generation.
MONITORING_DISABLED	A server environment variable that, when set to 'true', pauses all automated Reddit and Google Alerts monitors.
Bookmarklet	A small JavaScript program saved as a browser bookmark. Clicking it runs the script on the current page.
